1 Introduction

1.1 Preface

The Windsor Essex Parkway (the Parkway, or the WEP) was conceived to strengthen transportation and trade links between Canada and the United States, reduce road congestion, and foster economic growth. The Parkway will connect Highway 401 to a new Canadian inspection plaza and a new international crossing over the Detroit River to Interstate 75 in Michigan, USA. It will be a six-lane highway, 11 km long with 15 bridges, 11 tunnels and a four-lane service road that will provide full access to schools, neighbourhoods, natural areas, and shopping. Other components of the project include community and environmental features, such as: 300+ acres of green space, 20 km of recreational trails, extensive landscaping throughout the corridor, as well as noise and environmental mitigation measures.

1.2 Report Introduction

This report presents the pile group analysis for Bridge B-11, located in Lasalle sector of the proposed WEP project. Bridge B-11 carries traffic of Highway 3 over Highway 401. The proposed structure consists of two parallel bridges up to 190 m in length; each bridge will have four spans varying in length from 23 to 67 m. The eastbound bridge will be approximately 12 m wide while the westbound bridge will be approximately 14.5 m wide, as shown on Drawing 285380-03-060-SEG1-S1101 (not included herein).

The proposed design for Bridge B-11 incorporates two parallel bridge structures, comprised of a two cell box girder for the North structure and a single-cell box girder for the South Structure. Each structure will be constructed with a cast-in-place post-tensioned box girder with true abutments and three intermediate piers founded on end bearing H-piles driven to refusal in the bedrock (ref. R-2). Per Reference R-5, section 903.05.02.01, the proposed H-piles are Grade 350 W (Fy of 350 MPa). The pile group analysis has been developed through interactive collaboration of the geotechnical and structural disciplines to determine the pile cap size, pile layout, pile batter, and pile size to resist the loads from the bridge.

The report includes the results of the numerical pile modelling carried out to support the design.

2 Soil Parameters

The soil parameters and soil stratigraphy used in the pile group analysis were determined from the geotechnical report by AMEC (ref. R-2). The following soil strength parameters were used in the analysis.

Table 2-1: Soil Parameters for Group Analysis

Soils Around the Piles	Elevation Range	Design Bulk Unit Weight (kN/m ³)	Undrained Shear Strength, S _u (kPa)	ε ₅₀
Native Silty Clay Crust	Above 177	22	75	0.005
Native Transition Clay	177 to 175	21.5	Decreases linearly with depth from 75 to 55	0.007
Upper Silty Clay - 1	175 to 166	21	Decreases linearly with depth from 55 to 50	0.010
Upper Silty Clay - 2	166 to 163	20.5	Increase linearly with depth from 50 to 58	0.010
Native Lower Clayey Silt - 1	163 to 161	22	Increases linearly with depth from 58 to 100	0.007
Lower Clayey Silt - 2	161	22	100	0.005

3 Group Pile Foundation Analysis

3.1 Group V8.0 Program

Pile group analysis was performed using the p-y curve approach which accounts for the soil nonlinearity. Reference R-3 lists several commercially available software packages for this type of analysis.

The group of piles and pile cap which support each of the abutments and piers in bridge B-11 were analyzed using the computer program GROUP V8.0.

GROUP is a soil-structure interaction program that was developed by ENSOFT, INC. (ref. R-6). The program provides the user with the capability of analyzing the behaviour of a pile group using either 2-dimensional model or 3-dimensional model. The program analyzes a symmetrical pile layout for the 2-dimensional model. For the 3-dimensional model, the pile group does not need to be symmetrically arranged. The piles may be installed vertically or on a batter with pile heads fixed, pinned or elastically restrained by the pile cap. Pile group can contain different pile sections.

The program computes the distribution of applied loads (vertical, lateral and overturning moments) from the pile cap to individual piles in the group. The program internally generates the nonlinear response of the soil in the form of curves for the axial, lateral, and torsional loadings. The nonlinear response of each pile is determined through an iterative solution that satisfies the equations of equilibrium and achieves compatibility between pile movement and soil response, and between pile cap and pile-head movements.

Input to the program includes pile cross section(s), pile material properties, pile length, pile head coordinates (see Drawings in Appendix B) including pile batter angle, dimensions of pile cap, soil layers with associated soil properties and loads applied to the pile cap.

The program output includes axial and lateral forces and moments at the pile head, pile head displacements and rotations, deflections along pile length, shear and moment along pile length, pile cap stiffness coefficients and pile cap displacements and rotations. GROUP provides a graphical presentation of the results.

3.2 Analysis Procedure

For Bridge B-11, GROUP was used to analyze the pile caps at all abutments and piers. A 3-dimensional model was used to determine the loads distributed to the piles for each pile cap configuration. The pile group analysis was an iterative process. This process included analyzing an initial pile cap configuration with both vertical and battered piles of HP310x110 which was provided to AMEC by the bridge designers from Hatch Mott McDonald (HMM). Using the initial pile cap configuration, the pile cap loads (axial, lateral, and moments, ref. R-4) provided by HMM was applied to the bottom center of the pile cap. The results calculated by GROUP were summarized in tables (see Appendix C). The information included in the summaries was pile loads at each pile and pile cap stiffness coefficients. Formulas, based on the

reference R-4, were used to check combined stress, shear, and bending for the ULS load conditions (see Appendix A). According to Reference R-2, the geotechnical capacity of the piles driven to rock did not govern the design.

The analysis was performed for pinned head conditions which correspond to what is expected to occur in the field as the piles are subjected to the loads from the abutments and piers. For the pinned head condition, the maximum moment in the piles occur below the top of each pile. The calculated maximum lateral loads and moments in each pile are presented in the summaries. In addition, the summary provided calculations to check the stresses in piles caused by the resulting pile loads. HMM reviewed the preliminary pile loads and stresses according to the initial pile configuration and determined whether to remove unnecessary piles or add additional piles. Also, using the pile cap stiffness coefficients, HMM reran their structural analysis to determine new pile cap loads. New pile configurations and new pile cap sizes along with new pile cap loads were then provided to AMEC for the pile group analysis. This process was repeated until a satisfactory pile cap size and configuration was determined and the pile cap loads converged.

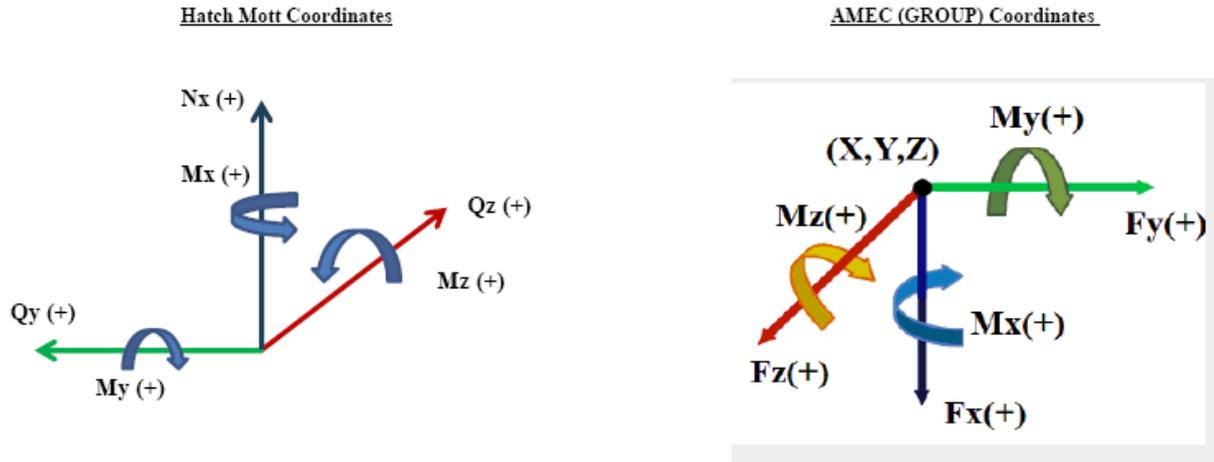

3.3 Negative Skin Friction

Negative Skin Friction (NSF) values used in the analysis were also taken from Reference R-2. NSF occurs in conjunction with soil settlement around the piles. NSF is independent of the bridge loading, and is principally a function of ground movement and the ratio of soil/pile stiffness at each of the structures due to adjacent soil loading. Therefore, our Group Analysis did not directly consider NSF. However, NSF values indicated in Reference R-2 were added to the factored Dead Load Case for the structures and included in the pile capacity checks.

3.4 Coordinate System

Note that the coordinate system used in the GROUP program is different from the coordinate system used by the bridge designers. Figure 3-1 illustrates the correlation between the two coordinate systems. The loads provided were based on HMM coordinate system. The loads were correlated to the GROUP coordinate system and the calculation was completed according to the GROUP coordinate system. The results from the GROUP analyses were transferred to the spreadsheets and correlated back to HMM's coordinate system. Appendix B includes the pile layout drawings showing pile batter directions. The GROUP analyses results are shown in Appendix C and include the calculated pile loads. The load results are shown in HMM's coordinate system.

4 Limitations of Report

The work performed in this report was carried out in accordance with the Standard Terms and Conditions made part of our contract. The conclusions and recommendations presented herein are based solely upon the scope of services and time and budgetary limitations described in our contract.

The analyses given in this report are based on data and pile recommendations presented in the AMEC geotechnical report for this specific structure (ref. R-2). All limitations of that report are hereby incorporated by reference into this report. The analyses given in this report are applicable only to the project described in the text and then only if constructed substantially in accordance with the details stated in this report.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. AMEC accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

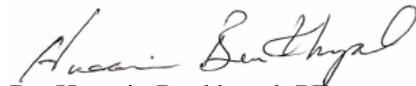

5 Closure

The pile analyses for Bridge B-11 was developed by Dr. Hussein Benkhayal, PE and Mr. Siphay Douangvilay, M.Sc. EI. The project was executed under the technical direction of Dr. Don Dotson, PE, P.Eng. The report was reviewed by Mr. Douglas Tate, PE. Mr. Brian Lapos, P.Eng. is the project manager.

The cooperation received from Ms. Biljana Rajlic, P.Eng. Mr. Radek Falar, and Mr. Vojtech Hruska of Hatch Mott McDonald during the analyses is gratefully acknowledged.

Yours truly,

AMEC Environment & Infrastructure
a Division of AMEC Americas Limited

$$d = 308 \text{ mm}$$

$$w = 15.4 \text{ mm}$$

Checks are incorporated into the spreadsheets to determine if piles are overstressed and an alternate configuration is required.

Properties for HP310x110 Grade 350 W per MTO OPSS 903

Note that calculations from MTO below are shown for major axis in x-direction. For project calculations, the z-direction is the major axis.

10.10.3.2 Laterally supported members

When continuous lateral support is provided to the compression flange of a member subject to bending about its major axis, the factored moment resistance, M_r , shall be calculated as

$$M_r = \phi_s S_x F_y = \phi_s M_y$$

10.10.3.5 Bending about the minor axis

For a section subjected to bending about its minor axis, whether laterally braced or unbraced, the factored resistance, M_r , shall be calculated as

$$M_r = \phi_s S_y F_y = \phi_s M_{ry}$$

Resistance

Definition

$$\phi_s = 0.70$$

Resistance Factor: Compression

$$C_r = \phi_s A F_y = 3454.5 \text{ kN}$$

Factored compressive resistance (laterally supported)

$$\phi_s = 0.95$$

Resistance Factor: Shear and Flexure

$$M_{rz} = \phi_s S_z F_y = 5.121 \times 10^5 \text{ kN} \cdot \text{mm}$$

Factored strong axis (z-axis) elastic bending capacity (Laterally supported)

$$M_{ry} = \phi_s S_y F_y = 1.653 \times 10^5 \text{ kN} \cdot \text{mm}$$

Factored weak axis (y-axis) elastic bending capacity (laterally supported)

10.10.5.1 Factored shear resistance

The factored shear resistance of the web of a flexural member, V_r , shall be taken as

$$V_r = \phi_s A_w F_s$$

where A_w , the shear area, is calculated using d for rolled shapes and h for fabricated or manufactured girders, and F_s , the ultimate shear stress, is equal to $F_{cr} + F_t$, where F_{cr} and F_t shall be taken as follows:

(a) when $\frac{h}{w} \leq 502 \sqrt{\frac{k_v}{F_y}}$:

$$F_{cr} = 0.577 F_y$$

$$F_t = 0$$

$$A_w = dw = 47.432 \text{ cm}^2$$

$$V_{rz} = 1844\text{kN}$$

Factored shear resistance parallel to HMM z-axis

$$V_{ry} = 910\text{kN}$$

Factored shear resistance parallel to HMM y-axis

Values to be calculated by analysis

<u>Value</u>	<u>Definition</u>
C_f	Factored compressive force determined by analysis
M_{fz}	Factored bending moment about z-axis
M_{fy}	Factored bending moment about y-axis
V_{fz}	Factored shear force parallel to HMM z-axis
V_{fy}	Factored shear force parallel to HMM y-axis

Ratio Checks

Reference: Canadian Standard Association, 2006. Canadian Highway Bridge Design Code (CHBDC). CAN/CSA-S6-06 S6.1.0

10.9.4.1 Cross-sectional and member strengths — All classes of sections except Class 1 sections of I-shaped members

Members subject to coincident bending and axial compressive force shall be proportioned so that

$$\frac{C_r}{C_r} + \frac{U_{1x}M_{fx}}{M_{rx}} + \frac{U_{1y}M_{fy}}{M_{ry}} \leq 1.0$$

where

U_{1x} = the value as specified in Clause 10.9.4.2, but not less than 1.0

U_{1y} = the value as specified in Clause 10.9.4.2

The resistance of the member shall be determined by taking the following into consideration:

- Cross-sectional strength, for which $C_r = \phi_s A F_y$; M_{rx} and M_{ry} are defined by M_r in Clause 10.10.2.2 for Class 2 sections and Clause 10.10.3.2 for Class 3 sections, with respect to the x -axis and y -axis, respectively; and U_{1x} and U_{1y} are taken as 1.0.
- Overall member strength, for which C_r is as specified in Clause 10.9.3.1 and is based on the maximum slenderness ratio for biaxial bending. For uniaxial strong axis bending, $C_r = C_{rx}$. M_{rx} and M_{ry} are as specified in Item (a) and U_{1x} and U_{1y} are as specified in Clause 10.9.4.2.

10.10.5.2 Combined shear and moment

When subject to the simultaneous action of shear and moment, transversely stiffened webs that depend on tension field action to carry shear, i.e., with $h/w > 502\sqrt{k_v/F_y}$, shall be proportioned so that

(a) $\frac{V_f}{V_r} \leq 1.0$;

(b) $\frac{M_f}{M_r} \leq 1.0$; and

(c) $0.727\frac{M_f}{M_r} + 0.455\frac{V_f}{V_r} < 1.0$

where V_r is determined in accordance with Clause 10.10.5.1 and M_r is determined in accordance with Clause 10.10.2, 10.10.3, or 10.10.4, as applicable.

- NOTES: (STANDARD)**
- FOR GENERAL NOTES SEE DWG S1101.
 - THIS DRAWING TO BE READ IN CONJUNCTION WITH DWG S1109 AND S1110.
- PILE NOTES:**
- PILE LENGTHS SHOWN ARE ESTIMATED LENGTHS FROM THE CUT-OFF TO THE ESTIMATED BEDROCK / REFUSAL SURFACE.
 - ALL PILES ARE HP 310X110 STEEL H PILES.
 - ALL PILES SHALL BE FITTED WITH TYPE I DRIVING SHOE PER OPSP 3000.100 OR APPROVED EQUIVALENT.
 - PILE SPLICES SHALL BE BUTT WELDED AS PER OPSP 3000.150 AND OPSS 903. SPLICE PLATES ARE NOT PERMITTED.
 - ALL PILES ARE TO BE DRIVEN TO BEDROCK OR TO REFUSAL IN THE VERY DENSE COHESIONLESS DEPOSIT OVERLYING BEDROCK IN ACCORDANCE WITH SS103-11 TO DEVELOP AN ULTIMATE GEOTECHNICAL RESISTANCE OF 4000 KN, GIVING A DESIGN FACTORED ULS RESISTANCE OF 2000 KN.
 - THE PILE ULTIMATE GEOTECHNICAL RESISTANCE AND REFUSAL CRITERIA SHALL BE CONFIRMED ON AT LEAST 3% OF THE PILES BY PDA METHOD SUPPLEMENTED WITH STATIC LOAD TESTS IN THE AREA OF THE STRUCTURE.
 - PILE DRIVING EQUIPMENT SHALL BE APPROPRIATE TO THE DRIVING CONDITIONS TO DEVELOP THE ULTIMATE GEOTECHNICAL RESISTANCE, AND PREVENT DAMAGES TO THE PILES DURING DRIVING. CONSIDERATION SHOULD BE GIVEN TO POTENTIAL DRIVING DIFFICULTIES DUE TO THE PRESENCE OF COBBLES OR BOULDERS.
 - HAMMER DETAILS (HAMMER TYPE AND MODEL, RATED ENERGY, HELMET AND CUSHION DETAILS) SHALL BE SUBMITTED 10 DAYS PRIOR TO THE EQUIPMENT MOBILIZATION TO THE SITE.
 - SURVEY ALL PILE HEAD ELEVATIONS AT END OF DRIVING AND JUST PRIOR TO FORMING OF PILE CAP. RE-TAP PILES WHERE UPLIFT >5 MM OR AS DIRECTED BY THE ENGINEER.
 - THE CONTRACTOR SHALL MONITOR FOR POTENTIAL EMISSIONS OF NATURAL GASES AND GROUNDWATER SEEPAGE DURING PILE DRIVING AND IMPLEMENT MITIGATION MEASURES AS REQUIRED.
 - THE CONTRACTOR SHALL MONITOR VIBRATIONS AT STRATEGIC LOCATIONS (E.G. TEMPORARY SLOPES, UTILITIES AND STRUCTURES) AND ESTABLISH APPROPRIATE FREQUENCY BASED LIMITS ON PEAK PARTICLE VELOCITIES IN ORDER TO PREVENT DAMAGE CAUSED BY PILE DRIVING.
