

SUPPLEMENTARY
FOUNDATION INVESTIGATION REPORT
For

Q.E.W. and Hwy. #22 Interchange,
Twp. of Etobicoke, County of York,
District #6 (Toronto).
W.P. 275-64-1 and W.P. 275-64-4
W.J. 65-P-104

INTRODUCTION:

Since the original foundation investigation report for the above mentioned interchange was prepared, we have received the preliminary plans for the individual structures involved which show the exact locations of each. We have reviewed these plans with respect to the available soil information, and as a result of this review, we arranged for more borings to be carried out in the field to obtain additional information.

Field work, laboratory work, and the preparation of the Record of Borehole sheets, for the additional borings, were undertaken by Dominion Soil Investigation Ltd. at our request and according to a program decided upon by us.

The following pages contain a description of the subsoil conditions prevailing at each structure location, together with our final recommendations for the structure foundations.

This report was prepared by Mr. A. Barvary, Senior Foundation Engineer, under the general supervision of Mr. K. G. Selby, Supervising Foundation Engineer.

G.E.W. and Hwy. #27 Interchange, Dist. 6 (Toronto)

Dear Sir:

This is to authorize you to carry out a foundation investigation at the above mentioned site.

You are requested to carry out borings at locations which will be specified by us, to carry out all field and laboratory work necessary to define the soil conditions at each boring, and to furnish us with completed borelog sheets, and where necessary, summaries of laboratory tests.

Arrangements will be made to have the borehole locations staked out in the field by personnel from District #6 construction staff.

This work should be started immediately, and you are requested to submit eleven (11) copies of each borelog sheet, and

where applicable, the same number of laboratory test result sheets.

Charges for the work will be in accordance with your Schedule of Rates effective April 1, 1966, and the invoice should be addressed to the attention of the undersigned.

We are attaching Purchase Order J 24815, covering the purchase of any new material required for this work, in order that you may use this as a basis for exemption from the Federal Tax for such purchases. The Exemption Certificate is printed thereon.

Yours very truly,

a.l

Notes on Bedrock encountered on Job No. 6-10-21

Bedrock was encountered in all eight boreholes, approximately at the elevations shown on the preliminary subsoil profiles.

The bedrock consisted of a brown to grey shale with layers of limestone and occasional clay seams. The upper surface of the shale in each borehole was weathered for approximately 2 to 4 feet. This weathered layer would be relatively easy to excavate by mechanical means.

Even below the weathered zone the shale exhibits numerous cleavage planes. Consequently it could be excavated without resorting to blasting techniques, although this would greatly expedite matters.

In a nearby excavation, it was observed that a large backhoe had penetrated about 5 feet into the shale. By questioning the work crew concerned it was found that the excavation had taken several days.

In summation: It is considered that mechanical excavation of up to 5 feet of bedrock is practical. The length of time taken for excavation can, however, not be estimated with any degree of accuracy.

MEMORANDUM

To: Mr. A. Stermac,
Principal Foundation Engineer.

From: Mr. A. Rutka,

Date: August 23, 1966.

OUR FILE REF.

IN REPLY TO:

Subject: Elevation of Bedrock, Vicinity of Q.E.W. & Hwy. 27

With reference to your memorandum of August 19, 1966, to Mr. Kovich, I would comment as follows:

1. The definition of rock excavation in Form 200, Section 207-01, is as follows:

"material excavated from solid masses of igneous, sedimentary or metamorphic rock which, prior to removal, was integral with the parent mass".

As you can see this definition incorporates weathered rock.

2. I do not think we need a new definition for rock. The problem seems to be one of identifying and classifying the boundaries of overburden, weathered rock and solid rock, during the soils investigation. This is the function of Materials and Testing, and it can be done by having knowledge of the geology of the area, and also of past experiences during construction.
3. It has been our practice to indicate the physical condition of the rock with respect to weathering, and we have left the decision as to the type of excavation equipment necessary, to the contractor. I think this procedure should still continue. A lot of literature is available on the rippability of bedrock, and it is possible to rip even sound sedimentary rock, depending upon the size of the ripper, and the size of the tractor. Therefore, it would not be possible for us to decide on the type of excavation equipment required in most instances.

A. Rutka,
Materials & Testing Engineer.

FOUNDATION INVESTIGATION REPORT

For

Q.E.W. & Hwy. #27 Interchange
Twp. of Etobicoke, County of York
District #6 (Toronto)
W.J. 65-F-104 - W.P. 275-64-1

1. INTRODUCTION:

A request for a foundation investigation at the site of the proposed new Q.E.W. and Hwy. #27 interchange, was received from the Bridge Location Section, in a memo dated August 10, 1965. Due to the fact that about twenty new structures would be involved in this project and also, that the final geometrics were not then available, it was decided that the field investigation would be of a preliminary nature only, with one or two sampled boreholes being drilled for each structure or group of structures.

A preliminary foundation investigation was subsequently carried out by this Section to determine the subsoil conditions existing at the site of the proposed interchange. This report contains the results of the investigation together with recommendations pertaining to the foundations of the various proposed structures.

When the final geometrics for each structure are decided upon, it may be necessary to carry out more borings in the field. Recommendations given in this report are, therefore, to be regarded as conditional only, and as such, are subject to revision at a later date when and if new field information becomes available.

2. DESCRIPTION OF SITE:

The site is located in the general area of the intersection of Hwy. #27 and the Q.E.W. in the Twp. of Etobicoke, Metropolitan Toronto. The area covered by the investigation is bounded on the south by Evans Rd., on the north by the C.P.R., and extends easterly

2. DESCRIPTION OF SITE: (cont'd.) ...

along the Q.E.W. about 1/2 mile, and westerly, about one mile. The surrounding district is heavily built up both of light industry and residential buildings. The topography of this area may be described as flat to gently undulating.

Physiographically, the area is situated in the low-lying part of the region referred to as the Iroquois Plain which was formed during the late Pleistocene period by the body of water since designated Lake Iroquois. Soils in this part of the region are mainly heavy textured shale and limestone tills.

3. FIELD WORK:

A total of 22 sampled boreholes and 21 dynamic cone penetration tests was carried out during the course of the field work. Boring was achieved by means of conventional diamond drilling equipment adapted for soil sampling purposes. Samples were recovered at various depths by means of split-spoon samplers which were driven into the soil by means of a 140-lb. hammer imparting an energy of 350 foot lbs. per blow. Samples were visually examined and classified in the field before being transported to the laboratory. Ground water observations were carried out both during and after boring operations.

The boreholes were located and surveyed in the field by personnel from the construction staff of District #6. Drawing No. 65-F-104A shows the locations and elevations of the boreholes and Drawing No. 65-F-104B shows various estimated stratigraphical profiles through the area investigated.

4. LABORATORY TESTING:

A careful visual inspection of all samples was carried out in the laboratory. Tests were then carried out on a number of selected samples, primarily for classification purposes. These tests consisted of moisture content determinations and particle size analyses. The results are summarized on the borelog sheets contained in the Appendix of the report.

5. SOIL TYPES AND SOIL CONDITIONS:

5.1) General:

Subsoil over the site area consists generally of deposits of silty sand followed by clayey silt, sand and gravel (glacial till), followed by shale bedrock. The depth to bedrock ranges from about 4 feet (el. 365.0) at the south end of the project to about 30 feet (el. 350.0) at the north end. The boundaries between the different deposits are shown on the borelog sheets contained in the Appendix. The estimated stratigraphical profiles shown on Drawing No. 65-F-104B are based upon this information. A description of the various soil types follows:

5.2) Fill Material:

The fill material contained in the highway embankments in this area consists generally of borrow material obtained from the underlying glacial till and silty sand deposits. The properties of the fill material are in the main, similar to those of the underlying deposits except as regards relative density or consistency. Borings which intersected the fill showed the material to be in a loose to dense state in the case of the granular soils, and stiff to hard in the case of the cohesive soils.

5.3) Silty Sand:

This material covers most of the area and has an average depth of about 5 feet. Grain size distribution curves indicate the following average composition: gravel 7%, sand 63%, silt 26%, clay 4%. The average moisture content is in the order of 10%. The relative density varies from loose to very dense, but is generally in the compact range.

5.4) Clayey Silt with Sand and Gravel:

This is the predominant subsoil deposit at the site. The material consists of a heterogeneous mixture of clayey silt, sand and gravel, and has a generally hard consistency. Mechanic analyses indicate the following average grain size composition: gravel 23%,

5. SOIL TYPES AND SOIL CONDITIONS: (cont'd.) ...

5.4) Clayey Silt with Sand and Gravel: (cont'd.) ...

sand 25%, silt 36%, clay 16%. The average liquid and plastic limits are approximately 29% and 17%, respectively. The average moisture content is in the order of 11%.

5.5) Bedrock:

Bedrock was encountered in all borings and is of the Dundas shale of Ordovician age. This rock is a thin to medium bedded, grey-green, soft platy shale containing numerous thin, hard limey beds that occur in the top section of the formation.

6. GROUND WATER CONDITIONS:

Over most of the site area, ground water in the boreholes ranged from about three to five feet below ground level. No artesian conditions were observed. The various levels established in the boreholes are shown on the borelog sheets and on Drawing No. 65-F-104B.

7. DISCUSSION AND RECOMMENDATIONS:

It is proposed to widen the Q.E.W. and Hwy. #27 at this location. This will involve the construction of a completely new interchange and about twenty new bridge structures. Generally speaking, subsoil conditions over the whole site area are favourable for spread footing type foundations, but this depends to a large extent on the finished grade levels. In some cases it may be necessary to resort to piles where footings can be located more economically within fill material.

The individual structures are identified by number on Drawing No. 65-F-104A, which shows a plan of the new interchange. Drawing No. 65-F-104B shows the estimated stratigraphical profiles at the sites of individual structures or groups of structures. The various structures are discussed individually or collectively where convenient, below:

7. DISCUSSION AND RECOMMENDATIONS: (cont'd.) ...

Structure No. 1 -

Spread footings may be founded at or below el. 358.0 assuming a design load of 3 t.s.f. Perched abutments can be founded on steel H-piles driven to bedrock.

Structure No. 4 -

Spread footings may be founded at or below el. 360.0 assuming a design load of 3.5 t.s.f. Perched abutments can be founded on steel H-piles driven to bedrock.

Structures No's 2, 3, & 5 -

Spread footings may be founded at or below el. 363.0 assuming a design load of 3 t.s.f. Perched abutments can be founded on steel H-piles driven to bedrock.

Structure No. 6 -

Spread footings may be founded at or below el. 353.0 assuming a design load of 3 t.s.f. Perched footings can be founded on steel H-piles driven to bedrock.

Structures No's 7, 8, 10, 11, & 12 -

Spread footings may be founded directly on bedrock assuming a design load of up to 10 t.s.f. The bedrock surface in this area is at approximate elevation 365.0. The degree of weathering cannot be determined precisely until such time as the surface of the rock is uncovered; provision should therefore be made for additional excavation below el. 365.0 of any badly weathered rock. Perched footings can be founded on steel H-piles driven to bedrock.

Structures No's 13 & 14 -

Spread footings may be founded within the glacial till stratum at or below el. 368.0. A safe pressure of 4.0 t.s.f may be assumed for design purposes. Perched footings can be founded on steel H-piles driven to bedrock.

7. DISCUSSION AND RECOMMENDATIONS: (cont'd.) ...

Structure No. 15 -

Spread footings may be founded at or below el. 375.0. A safe pressure of 3.0 t.s.f. may be assumed for design purposes. Perched footings can be founded on steel H-piles driven to bedrock or to practical refusal in the dense till stratum at about el. 360.0. Design loads for the piles should be the maximum allowable for the section used.

Structure No. 16 -

Structure footings may be founded either on spread footings at or below el. 382.0 assuming a design load of 3.0 t.s.f., or on steel H-piles driven to approximate elevation 370.0. In the case of the piles, the design loads should be the maximum allowable for the section used.

Structures No's 17, 18, & 19 -

These structures may be founded on spread footings at or below el. 360.0 assuming a safe pressure of 2.5 t.s.f., or on steel H-piles driven to bedrock. Design loads for the piles should be the maximum allowable for the pile section used.

Structure No. 20 -

Spread footings may be founded at or below el. 356.0 assuming a design pressure of 4.0 t.s.f. Perched footings within fill material can be supported on steel H-piles driven to bedrock. Design loads for the piles should be the maximum allowable for the section used.

Structure No. 21 -

This structure is the crossing of Q.E.W. over Etobicoke Creek. No borings were carried out at the site since shale bedrock outcrops over the entire area. The structure can be founded within the bedrock, allowing sufficient cover for frost protection and hydrological requirements. Design pressures may be as high as 10 t.s.f. if footings are placed on sound rock.

7. DISCUSSION AND RECOMMENDATIONS: (cont'd.)

Piled Foundations -

Although spread footing type foundations are feasible at all structure sites on this project, consideration should be given to the use of concrete caissons in order to utilize the high bearing capacity of the bedrock. In the event that serious consideration is given to this type of foundation, some drilling tests in the field are recommended in order to obtain information on the behaviour of ground water at the rock surface and in the weathered zone. This information would be particularly important in the case of 'belled-out' caissons. For estimating purposes it can be assumed that safe pressures of about 20 t.s.f. of base area can be achieved by caissons founded on sound bedrock.

8. SUMMARY:

A foundation investigation at the site of the proposed Q.E.W. and Hwy. #27 is reported. About twenty bridge structures will be constructed at this location. The foundation investigation is to be regarded as preliminary only, and further investigation may be necessary when the exact locations and final geometrics of the various structures are known. Recommendations contained in this report are conditional only, and are subject to change when and if new field information becomes available.

Subsoil at the site generally consists of sandy silt or silty sand overlying a very dense or hard deposit of clayey silt, sand and gravel (glacial till). The glacial till deposit is underlain by shale bedrock. Depth to bedrock ranges from about 4 feet to about 30 feet below existing original ground level.

Generally speaking, spread footing type foundations are feasible for all structures: recommended design pressures for spread footings in overburden range from 2.5 to 4.0 t.s.f. For spread footings on rock, a design pressure of 10 t.s.f. is recommended.

cont'd. /8

5. SUMMARY: (cont'd.) ...

For footings located in fill material, piled foundations are recommended. For steel H-piles driven to refusal on bedrock or to practical refusal in the glacial till stratum, the maximum allowable design loads for the particular pile section adopted should be used.

Consideration should be given to the use of concrete caissons as an alternative to other types of foundation. Concrete caissons founded on bedrock should achieve a safe capacity of 20 tons per square foot of base area. If it is desired to use concrete caissons, field drilling tests should be carried out.

9. MISCELLANEOUS:

The field work for this project was carried out during the period September 28 - November 17, 1965. Equipment used was owned and operated by Master Soil Investigation Ltd. Supervision of the field work was carried out by Mr. P. McGlone, Project Foundation Engineer. This report was written by Mr. K. G. Selby, Senior Foundation Engineer.

MEMORANDUM

To: Mr. A. Stermac,
Principal Foundation Engineer,
Room 107, Lab. Bldg.

From: Bridge Division,
Downsview, Ontario.

Date: August 10, 1965.

OUR FILE REF.

IN REPLY TO

Subject: Q.E.W. and Highway 27 Interchange,
District 6 - W.P. 275-64-1.

This confirms our conversation with you on August 6.

Enclosed please find a copy of the Functional Planning Report of above mentioned interchange as promised.

There are 20 bridge structures as shown on the key plan (page 43 and 44 of accompanying report).

For your convenience let me point out that pages 20 to 41 inclusive cover only abandoned schemes. The interchange is shown on pages 75 and 76 and 93 and 94. It is superimposed over the existing conditions. Since no better plans are available at this time, we hope that this will be sufficient information for you to conduct a foundation investigation.

According to the latest schedule the foundation report should be available on October 13, 1965.

Soil Conditions - Hwy. #27 and The Queensway,
W.P. 275-64-01 W.J. 65-F-104

As requested, we have prepared a summary of soil conditions at a number of locations on Hwy. #27, in the vicinity of the Queensway and North Queen St. The information has been obtained from borings recently carried out for Project #65-F-104.

		Ground				
B.H.	Elev.	<u>-- Location --</u>		<u>-- Subsoil Conditions --</u>		
12	369.7	179, 146 N.	208, 716 E.	0'- 5.3'	Sand - Loose to Dense.	
				5.3'- 9.0'	Weathered Shale.	
				9.0'-14.0'	Shaley Limestone.	
		Ground Water Level				
13	368.7	179, 225 N.	208, 969 E.	0'- 3.8'	Sand - Loose to Compact.	
				3.8'- 6.0'	Weathered Shale.	
				6.0'-14.6'	Shaley Limestone.	
		Ground Water Level				
14	369.8	179, 305 N.	209, 344 E.	0'- 5.0'	Sand - Loose to Dense.	
				5.0'- 6.5'	Weathered Shale.	
				6.5'-17.6'	Shaley Limestone.	
		Ground Water Level				
17	382.5	179, 502 N.	208, 862 E.	0'-11.0'	Clayey Silt, Sand, Gravel & Organics -	
				11.0'-13.2'	Loose.	
				13.2'-18.0'	Silty Sand - Compact.	
				18.0'-25.0'	Clayey Silt, Sand & Gravel - Very Dense.	
		Ground Water Level

W.P. 278-64	Bridge #16 ✓	D-5857-1P
W.P. 238-61-8	Bridge #20 ✓	D-5859-1

Attached are two prints of preliminary plans for the above structures. A general investigation of this area has already been carried out and report BA2270 (W.J. 65-F-104) with recommendations has been issued. These preliminary plans will enable you to carry out any further boring which you think may be necessary to confirm or amend your recommendations contained in the general report.

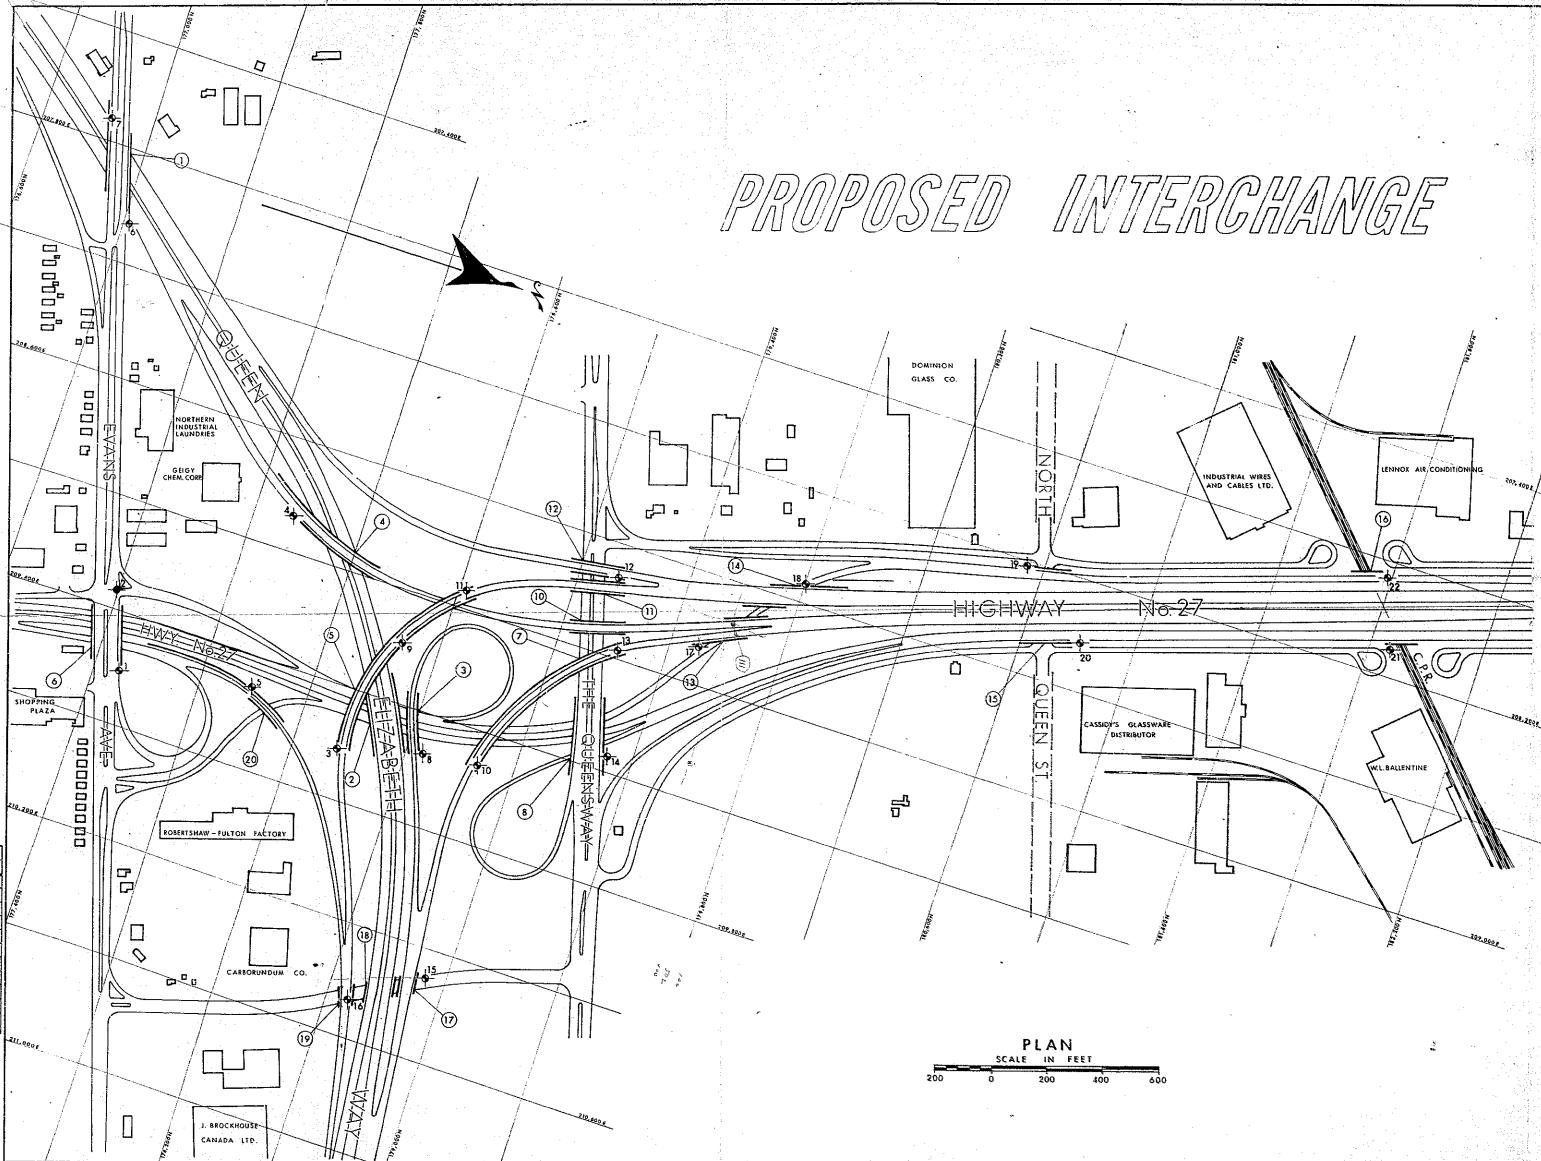

Structure #16; the widening of the C.P.R. Overhead is being designed by a consultant. The consultant has asked that borings be carried out to confirm footing elevations and specifically that a hole be put down behind each existing abutment at the centre median.

If you require any further information please do not hesitate to call us.
