Geocres Number: 31E-312

PART 1: FACTUAL INFORMATION

1 INTRODUCTION

This report presents the factual findings obtained from a foundation investigation conducted for the proposed replacement of the Oxtongue Lake Narrows Bridge on Highway 60, located approximately 9.7 km east of Highway 35 in the Township of McClintonck.

The purpose of the investigation was to explore the subsurface conditions at the site, and based on the data obtained, to provide a borehole location plan, record of borehole sheets, a stratigraphic profile, laboratory test results and a written description of the subsurface conditions. A model of the subsurface conditions was developed from the data obtained in the course of the investigation.

Thurber carried out the investigation as a sub-consultant to McCormick Rankin Corporation, under the Ministry of Transportation Ontario (MTO) Assignment Number 5009-E-0032.

2 SITE DESCRIPTION

The bridge site is located on Highway 60 approximately 9.7 km east of Highway 35 in the Township of McClintonck, Ontario. At present, Highway 60 crosses the Oxtongue Lake Narrows on an eleven span structure with a total length of 113.5 m. The water depth at the crossing is approximately 5 m.

The area surrounding the site is gently undulating and heavily treed, with occasional low rock outcrops. Private cottages and resort/motel establishments line the lakeshore. Photographs of the bridge and surrounding area are presented in Appendix D.

Physiographically, the site lies within the Canadian Shield, which is characterized by Pre-Cambrian igneous and metamorphic bedrock typically occurring as rounded knobs and ridges where exposed. At this site, the bedrock generally consists of the granitic gneiss. The bedrock is overlain by a discontinuous cover of sand and gravel (bedrock drift complex) and sand (glaciofluvial outwash).

3 SITE INVESTIGATION AND FIELD TESTING

The site investigation and field testing for this project were carried out during the period of September 8 to October 16, 2010. A total of twenty boreholes, identified as OX-01 to OX-20, were advanced to depths ranging from 9.2 m to 40.9 m below the drilling datum. Details of the borehole locations and depths were as follows:

Table 3.1 – Borehole Summary

Location	Boreholes	Water Depth (m)	Drilling/Coring Depth (m)	Drilling Datum
West Abutment	OX-01	-	36.1	Existing Highway 60 Pavement
West Abutment	OX-07	-	35.5	
East Abutment	OX-05	-	18.4	
East Abutment	OX-16	-	18.6	
West Pier	OX-02	4.8	18.6	Existing Highway 60 Bridge Deck
West Pier	OX-08	4.9	17.0	
Centre Pier	OX-03	5.1	21.3	
East Pier	OX-04	4.9	17.3	
East Pier	OX-10	4.9	19.6	
West Approach	OX-06	-	11.3	Existing Highway 60 Pavement
East Approach	OX-11	-	15.9	
Detour Bridge: West Approach	OX-12	-	9.8	Ground Surface
West Abutment	OX-13	-	40.9	
East Abutment	OX-17	-	19.5	
East Approach	OX-18	-	9.2	
Detour Bridge: West Pier	OX-14	5.1	20.8	Water Surface
Centre Pier	OX-09	5.4	23.3	
East Pier	OX-15	5.3	23.5	
RSS Wall	OX-19	-	9.8	Ground Surface
	OX-20	-	9.8	

The approximate locations of the boreholes are shown on the attached Borehole Locations and Soil Strata Drawing included in Appendix E.

Boreholes drilled from the existing Highway 60 roadway and bridge deck were advanced using a CME75 truck-mounted drill rig. Drilling located off of the road utilized a CME55 track-mounted drill rig, which was also mounted on a barge to drill the boreholes over water. Each drill rig used hollow stem augers and HW casing/washboring methods to advance the boreholes in the overburden.

Samples of the overburden soils were obtained from the boreholes at selected intervals using a split spoon sampler in conjunction with Standard Penetration Testing (SPT). To supplement the SPT data, Dynamic Cone Penetration Testing (DCPT) was carried out adjacent to Boreholes OX-01, OX-06 and OX-17, approximately 7 m east of Borehole OX-18 (OX-18A), and within Boreholes OX-10, OX-11 and OX-13. The DCPT tests were conducted to confirm the relative density of the cohesionless soils

where hydraulic disturbance may have affected the SPT results, and to aid assessment of the driveability of piles in material containing cobbles and boulders.

Core samples of the underlying bedrock were recovered from selected boreholes using HQ rock coring equipment. All rock cores were logged, and the Total Core Recovery (TCR), Solid Core Recovery (SCR), Rock Quality Designation (RQD) and the Fracture Indices (FI) were determined. The coring equipment was also used to penetrate 0.2 to 0.9 m of cobbles and boulders overlying the bedrock surface in Boreholes OX-09, OX-10, OX-13 and OX-17, and for the bottom 2.6 m (below 33.5 m depth, Elev. 334.2 m) of Borehole OX-01.

Groundwater conditions in the open boreholes were observed during the drilling operations. Standpipe piezometers consisting of 19 mm PVC pipe with a slotted screen were installed in boreholes OX-01, OX-03, OX-13, and OX-17. The completion details of the boreholes and piezometers are summarized in Table C1, Appendix C. Following the final water level reading, the piezometers were decommissioned in accordance with MOE Regulation 903 by filling the standpipe with Benseal grout, removing the protective casing, pulling the upper 2 to 3 m length of pipe, and restoring the ground surface.

The drilling and sampling operations were supervised on a full time basis by a member of Thurber's technical staff. The supervisor logged the boreholes and processed the recovered soil and rock samples for transport to Thurber's laboratory for further examination and testing.

4 LABORATORY TESTING

The recovered soil samples were subjected to Visual Identification (VI) and to natural moisture content determination. The results of this testing are shown on the Record of Borehole sheets included in Appendix A. Selected samples were also subjected to gradation analysis and the results of this testing program are summarized on the Record of Borehole sheets in Appendix A and shown on the figures included in Appendix B.

Point load testing was conducted on rock core samples retrieved from the boreholes. The results of the point load tests are shown on the borehole logs in Appendix A.

The completed laboratory testing is summarized in Table 4.1.

Table 4.1 – Summary of Completed Laboratory Testing

Laboratory Test	Number of Samples Tested	Material Type
Moisture Content	229	Soil
Sieve	44	Soil
Sieve and Hydrometer	17	Soil
Point Load	38	Rock

5 DESCRIPTION OF SUBSURFACE CONDITIONS

Reference is made to the Record of Borehole sheets included in Appendix A. Details of the encountered soil stratigraphy are presented in this appendix and on the "Borehole Locations and Soil Strata" drawings in Appendix E. An overall description of the stratigraphy is given in the following paragraphs. However, the factual data presented in the Record of Borehole Sheets governs any interpretation of the site conditions.

The subsurface stratigraphy encountered at the site generally consists of a pavement structure and embankment fill at the abutments and approaches, an organic silt layer on the lake bottom, and an underlying silt to silty clay layer, overlying a major sand to sand and gravel deposit. The sand and gravel deposit contains cobbles and boulders, and overlies bedrock. More detailed descriptions of the individual strata are presented below.

5.1 Asphalt and Concrete

Asphalt and concrete were encountered in Boreholes OX-01 to OX-05, OX-07, OX-08, OX-10 and OX-16 drilled through the existing bridge deck and approach slab. The thickness of the asphalt layer ranged from 80 to 100 mm. The thickness of the concrete ranged from 165 to 300 mm.

5.2 Fill

Existing embankment fill was encountered below the concrete in Boreholes OX-01, OX-05, OX-07 and OX-16, and at the ground surface in Boreholes OX-06 and OX-11 drilled on the roadway shoulder. The fill generally consists of sand, some gravel to sand and gravel. The fill extends to depths of 2.1 to 4.4 m (Elev. 363.4 to 365.6 m).

SPT 'N' values recorded in the embankment fill generally ranged from 11 to 48 blows/0.3 m penetration, indicating a compact to dense relative density. 'N' values of 2 to 7 blows/0.3 m were encountered in Borehole OX-06 and below 3.0 m depth in Borehole OX-01, indicating loose to very loose conditions. Measured moisture contents ranged from 3 to 12%, locally 20% in Borehole OX-06.

The results of grain size analyses conducted on samples of the sand fill are provided on the Record of Borehole sheets in Appendix A and illustrated in Figure B1 of Appendix B. The results are summarized as follows:

Gravel %	34 to 50
Sand %	46 to 62
Silt and Clay %	4

5.3 Topsoil

A 50 to 150 mm thick layer of topsoil was encountered surficially in Boreholes OX-18 to OX-20 drilled near the east shoreline. The topsoil thickness may vary between and beyond the borehole locations, and the data is not intended for quantity estimation purposes.

5.4 Organic Silt

Dark brown organic silt with occasional sand seams was encountered on the lake bottom. The thickness of the organic deposit generally increased towards the centre of the lake, and ranged from 3.3 m in Borehole OX-04 to 8.2 m in Borehole OX-03. The lower boundary was encountered at Elev. 350.6 to 355.8 m.

In all cases, the split spoon sampler sank under the self-weight of the rods ('N' = 0), indicating a very soft condition. Measured moisture contents ranged from 83 to 479%.

The results of grain size analyses conducted on samples of the organic silt with sand seams are provided on the Record of Borehole sheets in Appendix A and plotted in Figure B2 of Appendix B. The results are summarized as follows:

Gravel %	0
Sand %	2 to 57
Silt %	35 to 84
Clay %	8 to 14

5.5 Silt to Silty Clay

A layer of native silt typically containing some clay and trace sand was encountered below the organic deposit in all boreholes drilled in the lakebed, below the fill in Boreholes OX-01, OX-07 and OX-11 drilled in the existing bridge approaches, and below the topsoil in Boreholes OX-18 to OX-20 drilled on the east bank. In Boreholes OX-09, OX-14 and OX-15, this deposit graded to a silty clay/clayey silt.

The silt layer ranged from 1.1 to 5.5 m in thickness. In the lakebed, the lower boundary of the silt was encountered at depths of 13.0 to 18.3 m below the drilling datum, at Elev. 348.5 to 354.3 m. In the boreholes drilled in the bridge approaches and east bank, the lower boundary was at 3.0 to 7.2 m depth, Elev. 359.9 to 362.7 m.

SPT N-values recorded in the silt below the lakebed typically ranged from 0 to 5 blows/0.3 m, indicating a very loose to loose condition or very soft to firm consistency. Values of 19 and 24 (very stiff) were obtained locally in Borehole OX-15. The undrained shear strength measured by in situ vane testing in the cohesive zones ranged from 18 to 38 kPa. SPT N-values obtained in the boreholes on land varied from 6 to 32 blows/0.3 m, indicating a loose to dense condition.

Moisture contents measured in the silt varied from 11 to 37%, locally 132% in one sample from Borehole OX-09. The higher values are believed to reflect a higher clay content or the

presence of organics, and the lower values likely result from the existence of sand seams within the silt.

The results of grain size analyses conducted on samples of the silt to silty clay are provided on the Record of Borehole sheets in Appendix A and plotted in Figures B3 to B5 of Appendix B. The results are summarized as follows:

	Silt	Silty Clay/Clayey Silt
Gravel %	0 to 2	0 to 2
Sand %	2 to 28	1 to 5
Silt %	61 to 84	62 to 81
Clay %	10 to 14	12 to 35

5.6 Sand to Sand and Gravel

A thick deposit of cohesionless sand to sand and gravel was encountered surficially in Boreholes OX-12, OX-13 and OX-17, and below the fill and silt layers in all remaining boreholes. The gradation of this deposit varies with depth and location; however the coarser sand and gravel material appears to be more prevalent at greater depths and towards the east end of the site. Localized zones of silty sand were also present. Cobbles and boulders were encountered within this deposit at varying frequency.

The sand and gravel deposit overlies bedrock. Where bedrock was contacted, the thickness of this deposit ranged from 7.6 to 37.3 m, typically thickest at the west abutment. The boreholes that were not extended to bedrock were terminated in the sand and gravel at depths of 9.2 to 36.1 m (Elev. 331.6 to 356.5 m).

The upper boundary of the sand and gravel deposit was encountered at depths below drilling datum of 0.0 to 18.3 m (Elev. 348.5 to 365.8 m). The lower boundary (bedrock) was encountered at depths of 14.2 to 37.3 m (Elev. 328.2 to 352.8 m).

SPT N-values recorded in the sand to sand and gravel ranged from 3 blows/0.3 m (very loose) to 100 blows/0.025 m (very dense). In some cases, the low N-values may have resulted from hydraulic disturbance during drilling and sampling. High values may have resulted from driving on cobbles and boulders within the sand and gravel.

Moisture contents in the sand and gravel generally ranged from 8 to 23%.

The results of grain size analyses conducted on samples of the sand/gravel are provided on the Record of Borehole sheets in Appendix A and plotted in Figures B6 to B13 of Appendix B. The results are summarized as follows:

	Silty Sand	Sand	Sand and Gravel/Gravelly Sand
Gravel %	0 to 3	0 to 15	24 to 70
Sand %	65 to 67	83 to 97	23 to 70
Silt & Clay %	31 to 33	2 to 11	2 to 15

5.7 Bedrock

The overburden soils described above are underlain by granitic gneiss bedrock which was proven by coring at the foundation elements. Cobbles and boulders were encountered in Borehole OX-01 and the bedrock surface was not contacted. Table 5.1 summarizes the depth to bedrock and the bedrock surface elevations determined in the boreholes.

The bedrock is generally described as slightly weathered, medium grained, and pink/white and grey/black banded.

Total Core Recovery (TCR) in the bedrock was typically 100%, locally 90 and 98% in two core runs. TCR values of 60 to 81% were obtained in three initial runs where coring recovered cobbles and boulders above the bedrock surface.

The Rock Quality Designation (RQD) determined from the cores generally ranged from 57 to 100%, indicating fair to excellent rock quality. Lower RQD values of 29 to 42% were encountered in core runs from Boreholes OX-04 (Runs 1 and 2 at 23.2 to 24.1 m), OX-14 (Run 1 at 22.9 to 24.4 m) and OX-15 (Runs 3 and 4 at 26.7 to 28.8 m), indicating poor quality.

The Fracture Index (FI) of the rock, expressed as fractures per 0.3 m of core, typically ranged from 0 to 5. Two values of 10 or more were determined from each of Boreholes 10-09 and 10-14.

Table 5.1: Depth to Bedrock at Borehole Locations

Foundation Element	Borehole	Depth to Bedrock (m)	Bedrock Elevation (m)
Permanent Structure:			
West Abutment	OX-07	32.4	335.4
	OX-02	23.0	344.7
West Pier	OX-08	22.3	345.6
	OX-03	27.0	340.9
Centre Pier	OX-09	25.0	339.0
	OX-04	23.2	344.7
East Pier	OX-10	24.6	343.3
	OX-05	15.3	352.7
East Abutment	OX-16	15.3	352.8
Temporary Structure:			
West Abutment	OX-13	37.3	328.2
West Pier	OX-14	22.9	341.1
East Pier	OX-15	24.3	339.7
East Abutment	OX-17	14.2	351.3

The unconfined compressive strength of the rock, estimated from the results of point load tests conducted on the rock core samples, ranges between 100 and 225 MPa, indicating a very strong intact rock. One result of 75 MPa (strong) was recorded on a sample from Borehole OX-04. The point load test results are included on the borehole logs in Appendix A.

5.8 Water Levels

The majority of the boreholes were drilled through the lake bottom and/or the borehole sidewalls caved upon removal of the drill casing. In Borehole OX-06, groundwater was measured at 3.6 m depth (Elev. 364.1 m) upon completion of drilling.

Standpipe piezometers were installed in boreholes OX-01, OX-03, OX-13, and OX-17. The water levels measured in the piezometers upon completion and up to two months later are summarized in Table 5.2.

Table 5.2: Water Level Measurements

Borehole	Date	Water Level (m)	
		Depth Below Surface	Elevation
OX-01	14-Sep-2010	3.8	363.9
	15-Sep-2010	3.8	363.9
	17-Sep-2010	3.8	363.9
	18-Sep-2010	3.7	364.0
	19-Sep-2010	3.7	364.0
	20-Sep-2010	3.7	364.0
	15-Oct-2010	3.5	364.2
OX-03	20-Sep-2010	3.8	364.0
	15-Oct-2010	3.8	364.0
OX-13	02-Oct-2010	0.9	364.6
	14-Oct-2010	1.1	364.4
	15-Oct-2010	1.0	364.5
	02-Nov-2010	0.9	364.6
	22-Nov-2010	0.9	364.6
OX-17	20-Sep-2010	1.5	364.0
	23-Sep-2010	1.5	364.0
	24-Sep-2010	1.5	364.0
	25-Sep-2010	1.5	364.0
	26-Sep-2010	1.4	364.1
	27-Sep-2010	1.4	364.1
	02-Oct-2010	1.3	364.2
	14-Oct-2010	1.5	364.0
	15-Oct-2010	1.5	364.0
	02-Nov-2010	1.4	364.1
	22-Nov-2010	1.4	364.1

The water level in the lake varied from Elev. 363.9 to 364.2 m during the time of the fieldwork. The groundwater levels measured in the piezometers are essentially at or slightly above the water level in the lake. The lake and groundwater levels are expected to fluctuate seasonally and subject to precipitation patterns, and may vary from the levels presented in this report.

6 MISCELLANEOUS

George Downing Estate Drilling Limited of Hawkesbury, Ontario supplied the drill rig and conducted the drilling, sampling and in-situ testing operations. A truck-mounted CME #75 drill rig was used for the duration of the investigation and a track-mounted CME#55 drill rig was used where the truck mounted machine could not access.

Attainable Solutions Incorporated of Huntsville, Ontario supplied the barge that facilitated drilling from the lake surface.

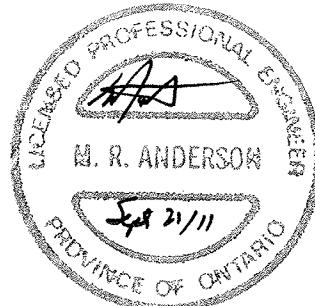

The co-ordinates and ground elevations at the boreholes were determined by McCormick Rankin Corporation following completion of the site investigation.

The drilling and sampling operations were supervised in the field by Mr. Ryan Kromer and Mr. Lukasz Gilarski E.I.T. of Thurber. Mr. Jason Lee, P.Eng. and Mr. Alastair E. Gorman, P.Eng. directed the field operations.

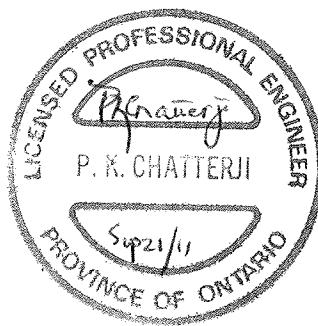

The report was prepared by Mr. Murray Anderson, P.Eng. and reviewed by Dr. P.K. Chatterji, P.Eng., a Designated Principal Contact for MTO Foundations projects.

Record of Borehole Sheets

SYMBOLS, ABBREVIATIONS AND TERMS USED ON RECORDS OF BOREHOLES

1. TEXTURAL CLASSIFICATION OF SOILS

CLASSIFICATION	PARTICLE SIZE	VISUAL IDENTIFICATION
Boulders	Greater than 200mm	same
Cobbles	75 to 200mm	same
Gravel	4.75 to 75mm	5 to 75mm
Sand	0.075 to 4.75mm	Not visible particles to 5mm
Silt	0.002 to 0.075mm	Non-plastic particles, not visible to the naked eye
Clay	Less than 0.002mm	Plastic particles, not visible to the naked eye

2. COARSE GRAIN SOIL DESCRIPTION (50% greater than 0.075mm)

TERMINOLOGY	PROPORTION
Trace or Occasional	Less than 10%
Some	10 to 20%
Adjective (e.g. silty or sandy)	20 to 35%
And (e.g. sand and gravel)	35 to 50%

3. TERMS DESCRIBING CONSISTENCY (COHESIVE SOILS ONLY)

DESCRIPTIVE TERM	UNDRAINED SHEAR STRENGTH (kPa)	APPROXIMATE SPT ⁽¹⁾ 'N' VALUE
Very Soft	12 or less	Less than 2
Soft	12 to 25	2 to 4
Firm	25 to 50	4 to 8
Stiff	50 to 100	8 to 15
Very Stiff	100 to 200	15 to 30
Hard	Greater than 200	Greater than 30

NOTE: Hierarchy of Soil Strength Prediction

- 1) Laboratory Triaxial Testing
- 2) Field Insitu Vane Testing
- 3) Laboratory Vane Testing
- 4) SPT value
- 5) Pocket Penetrometer

4. TERMS DESCRIBING DENSITY (COHESIONLESS SOILS ONLY)

DESCRIPTIVE TERM	SPT "N" VALUE
Very Loose	Less than 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very Dense	Greater than 50

5. LEGEND FOR RECORDS OF BOREHOLES

SYMBOLS AND ABBREVIATIONS FOR SAMPLE TYPE	SS Split Spoon Sample	WS Wash Sample	AS Auger (Grab) Sample
	TW Thin Wall Shelby Tube Sample	TP Thin Wall Piston Sample	
	PH Sampler Advanced by Hydraulic Pressure	PM Sampler Advanced by Manual Pressure	
	WH Sampler Advanced by Self Static Weight	RC Rock Core	SC Soil Core

Sensitivity = $\frac{\text{Undisturbed Shear Strength}}{\text{Remoulded Shear Strength}}$

Water Level
 C_{pen} Shear Strength Determination by Pocket Penetrometer

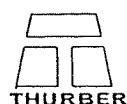

- (1) SPT 'N' Value Standard Penetration Test 'N' Value – refers to the number of blows from a 63.5kg hammer free falling a height of 0.76m to advance a standard 50 mm outside diameter split spoon sampler for 0.3 m depth into undisturbed ground.
- (2) DCPT Dynamic Cone Penetration Test – Continuous penetration of a 50 mm outside diameter, 60° conical steel point attached to "A" size rods driven by a 63.5 kg hammer free falling a height of 0.76 m. The resistance to cone penetration is the number of hammer blows required for each 0.3 m advance of the conical point into undisturbed ground.

UNIFIED SOILS CLASSIFICATION

MAJOR DIVISIONS	GROUP SYMBOL	TYPICAL DESCRIPTION	
COARSE GRAINED SOILS	GRAVEL AND GRAVELLY SOILS	GW	Well-graded gravels or gravel-sand mixtures, little or no fines.
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines.
		GM	Silty gravels, gravel-sand-silt mixtures.
		GC	Clayey gravels, gravel-sand-clay mixtures.
	SAND AND SANDY SOILS	SW	Well-graded sands or gravelly sands, little or no fines.
		SP	Poorly-graded sands or gravelly sands, little or no fines.
		SM	Silty sands, sand-silt mixtures.
		SC	Clayey sands, sand-clay mixtures.
	SILTS AND CLAYS $W_L < 50\%$	ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity.
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays. $(W_L < 30\%)$.
		CI	Inorganic clays of medium plasticity, silty clays. $(30\% < W_L < 50\%)$.
		OL	Organic silts and organic silty-clays of low plasticity.
FINE GRAINED SOILS	SILTS AND CLAYS $W_L > 50\%$	MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
		CH	Inorganic clays of high plasticity, fat clays.
		OH	Organic clays of medium to high plasticity, organic silts.
HIGHLY ORGANIC SOILS	Pt	Peat and other highly organic soils.	
CLAY SHALE			
SANDSTONE			
SILTSTONE			
CLAYSTONE			
COAL			

EXPLANATION OF ROCK LOGGING TERMS

<u>ROCK WEATHERING CLASSIFICATION</u>		<u>SYMBOLS</u>
Fresh (FR)	No visible signs of weathering.	
Fresh Jointed (FJ)	Weathering limited to the surface of major discontinuities.	 CLAYSTONE
Slightly Weathered (SW)	Penetrative weathering developed on open discontinuity surfaces, but only slight weathering of rock material.	 SILTSTONE
Moderately Weathered (MW)	Weathering extends throughout the rock mass, but the rock material is not friable.	 SANDSTONE
Highly Weathered (HW)	Weathering extends throughout the rock mass and the rock is partly friable.	 COAL
Completely Weathered (CW)	Rock is wholly decomposed and in a friable condition, but the rock texture and structure are preserved.	 Bedrock (general)
<u>DISCONTINUITY SPACING</u>		<u>STRENGTH CLASSIFICATION</u>
Bedding	Bedding Plane Spacing	Rock Strength Approximate Uniaxial Compressive Strength (MPa) (psi)
Very thickly bedded	Greater than 2m	Extremely Strong Greater than 250 Greater than 36,000
Thickly bedded	0.6 to 2m	
Medium bedded	0.2 to 0.6m	Very Strong 100-250 15,000 to 36,000
Thinly bedded	60mm to 0.2m	
Very thinly bedded	20 to 60mm	Strong 50-100 7,500 to 15,000
Laminated	6 to 20mm	
Thinly Laminated	Less than 6mm	Medium Strong 25.0 to 50.0 3,500 to 7,500
<u>TERMS</u>		Field Estimation of Hardness*
Total Core Recovery: (TCR)	Core recovered as a percentage of total core run length.	Weak 5.0 to 25.0 750 to 3,500
Solid Core Recovery: (SCR)	Percent Ratio of solid core of full cylindrical shape recovered. Expressed with respect to the total length of core run.	Very Weak 1.0 to 5.0 150 to 750
Rock Quality Designation: (RQD)	Total length of sound core recovered in pieces 0.1m in length or larger as a percentage of total core run length.	Extremely Weak (Rock) 0.25 to 1.0 35 to 150
Uniaxial Compressive Strength (UCS)	Axial stress required to break the specimen	
Fracture Index: (FI)	Frequency of natural fractures per 0.3m of core run.

Appendix C

Borehole Completion Details

Oxtongue Lake Narrows Bridge Replacement
Highway 60, Site 40-001

Table C1 – Borehole Completion Details

Borehole	Details		
	Piezometer Tip		Completion Details
	Depth (m)	Elevation (m)	
OX-01	36.0	331.7	3.0 m slotted screen at 36.0 m, sand filter to 30.5 m, bentonite from 30.5 to 6.1 m, cuttings to 0.15 m, and asphalt patch to surface. Flushmount casing installed.
OX-02	None Installed		Borehole caved to 9.0 m while pulling casing, then 0.3 m of concrete for bridge deck.
OX-03	27.4	340.4	3.0 m slotted screen at 27.4 m, sand filter to 23.8 m, bentonite from 27.4 to 9.1 m, then 0.3 m of concrete for bridge deck.
OX-04	None Installed		Borehole caved to 8.8 m while pulling casing, then 0.3 m of concrete for bridge deck.
OX-05	None Installed		Borehole caved to 3.2 m while pulling casing, bentonite from 3.2 to 0.4 m, and asphalt patch to surface.
OX-06	None Installed		Borehole caved to 4.7 m while pulling casing, bentonite from 4.7 to 2.0 m, then cuttings to surface.
OX-07	None Installed		Borehole caved to 3.2 m while pulling casing, bentonite from 3.2 to 1.5 m, cuttings to 0.3 m, then asphalt patch to surface.
OX-08	None Installed		Borehole caved to 8.6 m while pulling casing, then 0.3 m of concrete for bridge deck.
OX-09	None Installed		Borehole caved to 5.4 m while pulling casing.
OX-10	None Installed		Borehole caved to 8.8 m while pulling casing, then 0.3 m of concrete for bridge deck.
OX-11	None Installed		Borehole caved in to 4.4 m, bentonite holeplug from 4.4 m to 1.9 m, then cuttings to surface.
OX-12	None Installed		Borehole backfilled with bentonite holeplug and cuttings to surface.
OX-13	37.8	327.7	3.0 m slotted screen at 37.8 m, sand filter to 33.5 m, bentonite from 33.5 to surface. Protective casing installed.
OX-14	None Installed		Borehole caved to 5.1 m while pulling casing.
OX-15	None Installed		Borehole caved to 5.3 m while pulling casing.
OX-16	None Installed		Borehole caved to 4.6 m while pulling casing, bentonite from 4.6 m to 3.3m, cuttings to 0.3 m, then asphalt patch to surface.
OX-17	13.4	352.1	3.0 m slotted screen at 13.4 m, sand filter to 10.1 m, bentonite to 7.3 m, then cuttings to surface.
OX-18	None Installed		Borehole backfilled with cuttings and bentonite to surface.
OX-19	None Installed		Borehole backfilled with bentonite to 3.0 m, then cuttings to surface.
OX-20	None Installed		Borehole backfilled with cuttings and bentonite to surface.
