## 1.0 INTRODUCTION

AMEC Environment & Infrastructure, a Division of AMEC Americas Limited (“AMEC”), was retained by the Ministry of Transportation Ontario - West Region (“MTO”) to provide Detail Design Services for the Rehabilitation of Highway 21, Ontario. The project highway is about 20 km long stretching northerly from about 1.85 km south of Bayfield River Bridge (Bayfield) to about 0.17 km north of Huckins Street (Goderich), Ontario, as shown in Drawing No. 1.

In May 2011, AMEC conducted a foundation investigation comprising 21 boreholes (BH G1 to BH G21) at the locations of eight existing culverts identified for rehabilitation / replacement. The design reports for these culverts have been submitted to MTO separately.

In March 2012, AMEC conducted additional foundation investigations at the locations of 11 additional existing culverts, as shown on Drawing No. 1. The number of boreholes and locations of the boreholes were based on the Highway 21 Culvert Recommendations Table (dated 18 January 2012). The details of the additional culverts investigated, and the boreholes advanced at each location, are summarized in Table 1.1.

**Table 1.1 - Culvert Details for Additional Foundation Investigations (March 2012)\***

| Culvert No. | Station                    | Existing Culvert                    |                      | Boreholes Drilled | Proposed Work   | Foundation Investigation Requirement   |
|-------------|----------------------------|-------------------------------------|----------------------|-------------------|---|--|
|             |                            | Type                                | Dimension            |                   |   |  |
| 2           | 10+267                     | Concrete Rigid Frame - Open Footing | 0.9 x 0.9 x 38.5 m   | BH G22 and BH G23 | Extend culvert and clean out  | Two boreholes for extension  |
| 8           | 11+691 (Site No. 12-420/C) | Concrete Rigid Frame Box            | 3.75 x 2.30 x 68.4 m | BH G24 and BH G25 | Rehabilitate and install RSS, if necessary, to stabilize steep roadway embankment   | Foundations for RSS / slopes and protection system to stage the construction |
| 10          | 12+138                     | Concrete Box                        | 1.2 x 1.2 x 24.2 m   | BH G26 and BH G27 | Rehabilitate inlet, remove outlet precast block wing walls, place gabion wingwalls at east end. Construct CIP wingwalls at west outlet, including scour protection. | Two boreholes at outlet end for retaining wall foundations                   |
| 17          | 13+835                     | Concrete Box                        | 1.2 x 1.2 x 27.05 m  | BH G28 and BH G29 | Replace south west concrete retaining wall with CIP concrete retaining walls. Construct CIP concrete wingwall at northeast.   | Two boreholes (southwest and northeast retaining walls)                      |

| Culvert No. | Station                    | Existing Culvert              |                      | Boreholes Drilled                          | Proposed Work   | Foundation Investigation Requirement   |
|-------------|----------------------------|-------------------------------|----------------------|--|---|--|
|             |                            | Type                          | Dimension            |  |   |  |
| 20          | 15+205                     | Concrete Arch - Open Footing  | 7.16 x 3.66 x 29.6 m | BH G30                                     | Rehabilitate and install RSS to stabilize steep roadway embankment. Replace southwest wingwall  | Foundations for RSS / slopes (both side of the roadway) and protection system to stage the construction. Protection will be installed approximately 2.5 m from centerline. One borehole for S/W wingwall.  |
| 30          | 18+380 (Site No. 12-422/C) | Rigid Frame Box               | 3.66 x 1.52 x 21.4 m | BH G31, BH G32, BH G32A, BH G33 and BH G34 | Rehabilitate concrete at both ends and soffit and add wingwalls or extend culvert   | Boreholes required for a retaining wall between Culvert No. 30 (12-422/C), and Culvert No. 32 (12-424/C) on Highway 21 and Culvert No. 31 (12-423/C) on Cut Line Road , southeast of Intersection. Or lengthening of the culvert. (min. 4 BH for these 3 culverts total) |
| 31          | 18+393 (Site No. 12-423/C) |                               | 3.05 x 0.91 x 15.3 m |  | Rehabilitate and construct wing walls between this culvert and Culvert No. 30 (12-422/C)  |  |
| 32          | 18+409 (Site No. 12-424/C) |                               | 3.66 x 1.52 x 21.4 m |  | Rehabilitate and construct wing walls between this culvert and Culvert No. 31 (12-423/C)  |  |
| 34          | 18+843                     | Concrete Frame - Open Footing | 1.5 x 1.1 x 24.7 m   | BH G35 and BH G36                          | Rehabilitate ends and replace wingwalls with CIP concrete. Repair culvert interior. Extend inlet end.   | Two boreholes (one at each end)  |
| 56          | 25+232                     | Concrete Frame - Open Footing | 2.9 m x 0.9 x 20.8 m | BH G37                                     | Replace sandbag wingwalls with gabions at west end and CIP concrete retaining wall at east end. Repair outlet concrete. Place scour protection. | One Foundation borehole (east end)   |
| 61          | 26+521                     | Concrete Frame - Open Footing | 1.8 m x 1.2 x 23.5 m | BH G38 and BH G39                          | Rehabilitate ends and replace sand bag retaining walls with CIP concrete retaining walls  | Two Foundation boreholes (one at each end)   |

\* Based on Hwy 21 Culvert Summary Table (dated 13 December 2011), and Hwy 21 Culvert Recommendations Table (dated 18 January 2012).

The purpose of the additional foundation investigation was to obtain information on the subsurface conditions at the additional culvert sites (Table 1.1) by means of boreholes, in-situ tests and laboratory tests on selected soil samples. Based on AMEC's interpretation of the data obtained in the investigation, recommendations are provided on the geotechnical aspects of replacement / rehabilitation / extension of the culverts.

As per Terms of Reference (TOR) in the Request for Proposal (Purchase Order Number: 3009-E-0022, dated March 2010), separate reports have been prepared - one for each culvert site, except at the intersection of Highway 21 and Cut Line Road, where one report has been prepared for the three culverts located at the intersection.

This report presents the results of foundation investigation for the rehabilitation of existing Culvert No. 8 at Station 11+691 (Site No. 12-420/C).

The design discussion and recommendations for Culvert at Station 11+691, including factual results of the soil conditions encountered in the boreholes and laboratory tests, are presented in a separate report titled "Foundation Investigation and Design Report".

## **2.0 SITE AND PROJECT DESCRIPTION**

The investigated culvert site (at Station 11+691) is located at the existing watercourse (Dejong Creek) crossing Highway 21, about 740 m north of Bayfield River Road near Bayfield, Ontario (Drawing No. 1).

At this location, Highway 21 is a two-lane asphaltic concrete paved road with gravel shoulders on both sides with fence, and runs on top of an embankment built up above the surrounding grade. The surrounding area is primarily rural in nature, with active agricultural operations and farm houses / vacant lands / wood lots. The embankment slopes were covered with vegetation and trees at the time of the fieldwork.

Based on the Culvert Summary Table provided in Table 1.1 and the Preliminary Drawing No. S1 (Sheet No. ST1), the existing culvert at this location is a combination of Concrete Rigid Frame box and open footing type structures, about 68.4 m long with varying cross-sections. As per the drawing, the culvert is mainly a box structure, with a section (about 5.6 m long) constructed by using open footing structure. The height of the existing embankment is about 11.5 m above the existing grade at the inlet (east side), and about 14.0 m above the existing grade at the outlet (west side), with a slope of about 2H:1V. The design recommendations include rehabilitation of the culvert and installation of Retained Soil System (RSS) walls, if necessary, to stabilize roadway embankment.

Site photographs showing the culvert are presented in Appendix C (Photographs 1 to 4).

### **3.0 GEOLOGY**

Based on Map 2556 (Southern Sheet): 'Quaternary Geology of Ontario' prepared by Ministry of Northern Development and Mines of Ontario (1991), the site is located in an area of transition where the overburden comprises (i) St. Joseph Till (Huron - Georgian Bay lobe) consisting of silt to silty clay matrix, clay content increases southward, clast poor, and (ii) Glaciolacustrine deposits consisting of sand, gravelly sand and gravel; nearshore and beach deposits; and (iii) Glaciolacustrine deposits consisting of silt and clay, minor sand, basin and quiet water deposits.

### **4.0 INVESTIGATION PROCEDURES**

#### **4.1 Field Investigation**

In accordance with Highway 21 Culvert Recommendations Table, two (2) boreholes (BH G24 and BH G25) were advanced, each at the shoulder of Highway 21. The as-drilled borehole locations are presented on Drawing No. 2. Each borehole was extended to a depth of about 18.8 m below the existing ground surface, and terminated at an elevation of about 177.5 m in both boreholes (BH G24 and BH G25).

The fieldwork was performed on 12 and 13 March 2012, after acquiring all necessary permits for road occupancy, and obtaining clearance for underground utilities. The ground surfaces at the borehole locations were surveyed with reference to the nearest geodetic benchmark (BM HCP # 102, Sta. 10+449.955, El 197.134).

The drilling, sampling and in-situ testing operations were conducted by using hollow-stem augers, using a track-mount drilling rig, owned and operated by Drilltech Drilling Inc. (Newmarket, Ontario) under the full-time supervision of experienced AMEC geotechnical personnel.

Soil samples were generally taken at 0.76 m intervals for the initial 3 m of the borehole, and 1.5 m thereafter, while performing the Standard Penetration Test (SPT) in accordance with ASTM D1586. This consisted of freely dropping a 63.5 kg (140 lbs.) hammer for a vertical distance of 0.76 m (30 inches) to drive a 51 mm (2 inches) diameter O.D. split-barrel (split spoon) sampler into the ground. The number of blows of the hammer required to drive the sampler into the relatively undisturbed ground by a vertical distance of 0.30 m (12 inches) was recorded as SPT 'N' value of the soil which indicated the consistency of cohesive soils or the compactness of non-cohesive soils.

The groundwater conditions were observed in the boreholes during sampling and upon completion of drilling. The depths of groundwater, wherever encountered, are presented on the Record of Boreholes.

Upon completion of drilling, the boreholes were backfilled in accordance with the general requirements of Ministry of the Environment Regulation 903.

Upon recovery, all soil samples were screened using a hand-held hydrocarbon surveyor (RKI Eagle), the results of which are presented on the Record of Boreholes.

One selected sample was tested for soil corrosivity potential with respect to concrete and steel, the results of which are discussed in Section 6.7.

The soil samples were transported to AMEC's Advanced Soil Laboratory in Scarborough (Toronto) for further examination and laboratory soil testing. The program of laboratory testing, where applicable, included grain size analysis, Liquid and Plastic Limits, in-situ water content determination, and soil corrosivity analysis. Testing to determine the corrosivity of the soils was performed by Maxxam Analytics, an accredited CAEL laboratory located in Mississauga, Ontario.

The results of the in-situ and laboratory tests are presented in the corresponding Record of Boreholes (Appendix A) and Laboratory Test Results (Appendix B).

AMEC will retain the soil samples for a period of one year after completion of the project, unless otherwise advised in writing by MTO.

## **4.2 Laboratory Tests**

In accordance with the Terms of Reference for this investigation, the following tests were conducted in the laboratory:

- In-situ water content determination (30);
- Grain size distribution analysis (4);
- Atterberg Limit tests (4); and
- Soil corrosivity (1).

The results of in-situ and laboratory tests are presented in the Record of Boreholes in Appendix A. The grain size distribution curves and plasticity chart, and the results of soil corrosivity tests are shown in Appendix B.

## **5.0 SUB-SURFACE CONDITIONS**

Based on the investigation results, the soil profile consisted predominantly of surficial sand and gravel fill underlain by fill soils (silty clay / clayey silt / silty sand) overlying native clayey silt / silty clay deposit, which extended to the termination depth of both boreholes (BH G24 and BH G25) at an elevation of about 177.5 m.

The stratigraphic units and groundwater conditions at the borehole locations are discussed in the following sections. Detailed information is provided in the Record of Boreholes in Appendix A. Interpolated stratigraphical cross sections at the existing culvert are provided in

### Drawing No. 3.

It should be noted that the soil and groundwater conditions may vary between and beyond the borehole locations.

## **5.1 Sand and Gravel Fill**

Sand and gravel fill was encountered at the existing surface in both boreholes located on the road shoulder. The measured thickness of sand and gravel fill was about 1.4 m in Borehole BH G24, and 0.4 m in BH G25. The sand and gravel fill contained some silt. A pocket of silty clay was encountered in SS 2 in BH G24.

SPT N-values measured in the sand and gravel fill ranged from 10 to 12 blows per 0.3 m. The measured moisture contents in the sand and gravel fill ranged from 4 % to 12 %.

## **5.2 Silty Clay / Clayey Silt / Silty Sand Fill**

Silty clay / clayey silt fill was encountered below the sand and gravel fill in both boreholes. A silty sand fill was interbedded in Borehole BH G24 within the silty clay / clayey fill. The fill soils extended to about 9.1 m below the existing grade (Elevation 187.2 m) in Borehole BH G24, and about 6.1 m (Elevation 190.1 m) in BH G25.

The fill soils were brown / grey in color and contained trace to some sand, and trace gravel, cobbles / boulders and organic matter.

SPT N-values measured in the silty clay / clayey silt / silty sand fill ranged from 5 to 22 blows per 0.3 m. The measured moisture contents in the silty clay / clayey silt / silty sand fill ranged from 13 % to 21 %.

## **5.3 Clayey Silt / Silty Clay**

Native clayey silt / silty clay was encountered below the fill soils in both boreholes, and extended to the termination depth of about 18.8 m in both boreholes (Elevation 177.5 m in both boreholes).

The clayey silt / silty clay was brown/grey in color, and contained trace to some sand, and trace gravel and cobbles / boulders. The SPT 'N' values of the clayey silt / silty clay ranged widely from 11 to 83 blows per 0.3 m, indicating stiff to hard consistency. The measured moisture contents in the clayey silt / silty clay ranged from 12 % to 18 %.

Grain size analyses and Atterberg Limit tests were completed on 4 samples of the clayey silt / silty clay, and the results are presented in Table 5.1.

**Table 5.1 - Grain Size Distribution Analyses and Atterberg Limit Test Results  
 (Clayey Silt / Silty Clay)**

| Borehole No. | Sample No. | Depth (Elevation) (m)          | Grain Size Distribution |          |          |          | Atterberg Limit |               |                  | USCS Modified Group Symbol |
|--------------|------------|--------------------------------|-------------------------|----------|----------|----------|-----------------|---------------|------------------|----------------------------|
|              |            |                                | Gravel (%)              | Sand (%) | Silt (%) | Clay (%) | Liquid Limit    | Plastic Limit | Plasticity Index |                            |
| BH G24       | SS 10      | 10.7 - 11.2<br>(185.5 - 185.0) | 1                       | 16       | 47       | 36       | 26              | 13            | 13               | CL                         |
| BH G24       | SS 15      | 18.3 - 18.8<br>(178.0 - 177.5) | 2                       | 9        | 54       | 35       | 25              | 13            | 12               | CL                         |
| BH G25       | SS 9       | 9.1 - 9.6<br>(187.1 - 186.6)   | 2                       | 13       | 50       | 35       | 25              | 13            | 12               | CL                         |
| BH G25       | SS 14      | 16.8 - 17.4<br>(179.4 - 179.0) | 1                       | 2        | 68       | 29       | 21              | 13            | 8                | CL                         |

The grain size distribution curves are presented in Figure No. B 1, and the plasticity chart is presented in Figure No. B 2, in Appendix B.

#### 5.4 Groundwater Conditions

Groundwater conditions in the open boreholes were observed during and on completion of drilling. Both boreholes were dry on completion of drilling. It should be pointed out that the groundwater at the site would fluctuate seasonally and can be expected to be somewhat higher during the spring months and in response to major weather events and water level in Dejong Creek.

#### 5.5 Limited Environmental Investigation

In accordance with the Terms of Reference and AMEC proposal, soil samples obtained during the geotechnical field drilling program were field screened for evidence of environmental impact. The field screening activities included measuring the combustible organic vapours (COV) in the headspace of samples with a portable hydrocarbon surveyor instrument (RKI Eagle).

No visual or olfactory evidence of environmental impact was observed in the fill and native soil samples recovered from the boreholes. The measured COV concentrations in all soil samples were relatively low, ranging from non-detect to 140 ppm, with three samples recording slightly elevated values of 60 ppm and 140 ppm, as shown in the Record of Borehole. The samples recording slightly elevated values did not display any visual evidence of environmental impact. The COV results are semi-quantitative at best and are generally used only for relative sample comparison purposes when selecting samples for laboratory analysis. Based on the field screening results, environmental impact is not suspected.

## 5.6 Soil Corrosivity

To determine the soil corrosivity potential with respect to concrete and steel, one soil sample (BH G24 - SS 4) was submitted to Maxxam Analytics Laboratory in Mississauga, and tested for pH, soluble chloride, sulphate, electrical conductivity and resistivity. A summary of the test results are presented in the Table 5.2, while, the Certificate of Analysis is included in Appendix B.

**Table 5.2 - Results of Corrosivity Testing**

| Soil Sample No. | pH  | Electrical Conductivity $\mu\text{mho/cm}$ | Resistivity (ohms-cm) | Chloride ( $\mu\text{g/g}$ ) | Sulphate ( $\mu\text{g/g}$ ) |
|-----------------|-----|--|-----------------------|------------------------------|------------------------------|
| BH G24 - SS 4   | 7.5 | 771  | 1300                  | 380                          | <20                          |

The test results have shown that the sulphate content of the soil is <20 ppm ( $\mu\text{g/g}$ ). As per Table 3 "Additional Requirements for concrete subjected to sulphate attack", Clause 4.1.1.6 of CSA Standards Specification A23.1-09, any soil which has sulphate content below 0.1% (i.e., 1,000 ppm or  $\mu\text{g/g}$ ) is not considered aggressive with respect to concrete. As such, in accordance with Table 6 of CSA A23.1-09, Type GU (general use) cement can be used for concrete.

## 6.0 CLOSURE

The sub-soil information contained in this report should be used solely for the purpose of geotechnical considerations of the culvert site at Station 11+691 on Highway 21, near Bayfield, Ontario.

The Limitations of Report is an integral part of this report.

This report was prepared by Mohammad Mollah, M.Eng., P.Eng., and Shami Malla, M.Civ.Eng., P. Eng, and was reviewed by Prapote Boonsinsuk, Ph.D., P.Eng.

Sincerely,

**AMEC Environment & Infrastructure,  
a Division of AMEC Americas Limited**

**LIMITATIONS OF REPORT**

The information contained herein in no way reflects on the environmental aspects of the project, unless otherwise stated. Subsurface and groundwater conditions between and beyond the testholes may differ from those encountered at the testhole locations, and conditions may become apparent during construction, which could not be detected or anticipated at the time of the site investigation.

The number of testholes may not be sufficient to determine all the factors that may affect construction methods and costs. The contractors bidding on this project or undertaking the construction should, therefore, make their own interpretation of the factual information presented and draw their own conclusions as to how the subsurface conditions may affect their work. This work has been undertaken in accordance with normally accepted geotechnical engineering practices.

This report was prepared specifically for the culvert at Station 11+691 in Highway 21 near Bayfield, Ontario, as described in the report. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. AMEC Environment & Infrastructure, a Division of AMEC Americas Limited, accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

- NOTES:**
- The boundaries between soil strata have been established only at borehole locations. Between boreholes, the boundaries are assumed from geological evidence and may be subject to considerable error.
  - This drawing is for subsurface information only. Surface details and features are for conceptual illustration.
  - Borehole without was dry.

**APPENDIX A**  
**RECORD OF BOREHOLES**

## EXPLANATION OF BOREHOLE LOG

This form describes some of the information provided on the borehole logs, which is based primarily on examination of the recovered samples, and the results of the field and laboratory tests. Additional description of the soil/rock encountered is given in the accompanying geotechnical report.

### GENERAL INFORMATION

Project details, borehole number, location coordinates and type of drilling equipment used are given at the top of the borehole log.

### SOIL LITHOLOGY

#### ***Elevation and Depth***

This column gives the elevation and depth of inferred geologic layers. The elevation is referred to the datum shown in the Description column.

#### ***Lithology Plot***

This column presents a graphic depiction of the soil and rock stratigraphy encountered within the borehole.

#### ***Description***

This column gives a description of the soil strata, based on visual and tactile examination of the samples augmented with field and laboratory test results. Each stratum is described according to the *MTC Soil Classification Manual*.

The compactness condition of cohesionless soils (SPT) and the consistency of cohesive soils (undrained shear strength) are defined as follows (*Ref. MTC Soil Classification Manual*):

| Compactness of            |                     |
|---------------------------|---------------------|
| <u>Cohesionless Soils</u> | <u>SPT N-Value*</u> |
| Very loose                | 0 to 5              |
| Loose                     | 5 to 10             |
| Compact                   | 10 to 30            |
| Dense                     | 30 to 50            |
| Very Dense                | > 50                |

| Consistency of        |                                 |
|-----------------------|---------------------------------|
| <u>Cohesive Soils</u> | <u>Undrained Shear Strength</u> |
|                       | <u>kPa</u>                      |
| Very soft             | 0 to 12                         |
| Soft                  | 12 to 25                        |
| Firm                  | 25 to 50                        |
| Stiff                 | 50 to 100                       |
| Very stiff            | 100 to 200                      |
| Hard                  | Over 200                        |

\* For penetration of less than 0.3 m, N-values are indicated as the number of blows for the penetration achieved (e.g. 50/25: 50 blows for 25 centimeter penetration).

### Soil Sampling

Sample types are abbreviated as follows:

|    |              |    |                           |    |               |    |                   |
|----|--------------|----|---------------------------|----|---------------|----|-------------------|
| SS | Split Spoon  | TW | Thin Wall Open (Pushed)   | RC | Rock Core     | GS | Grab Sample       |
| AS | Auger Sample | TP | Thin Wall Piston (Pushed) | WS | Washed Sample | AR | Air Return Sample |

Additional information provided in this section includes sample numbering, sample recovery and numerical testing results.

### Field and Laboratory Testing

Results of field testing (e.g., SPT, pocket penetrometer, and vane testing) and laboratory testing (e.g., natural moisture content, and limits) executed on the recovered samples are plotted in this section.

### Instrumentation Installation

Instrumentation installations (monitoring wells, piezometers, inclinometers, etc.) are plotted in this section. Water levels, if measured during fieldwork, are also plotted. These water levels may or may not be representative of the static groundwater level depending on the nature of soil stratum where the piezometer tips are located, the time elapsed from installation to reading and other applicable factors.

### Comments

This column is used to describe non-standard situations or notes of interest.

# MTC SOIL CLASSIFICATION

### Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons. The extraction date for samples field preserved with methanol for F1 and Volatile Organic Compounds is considered to be the date sampled.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by Ontario Regulation 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

- \* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- \* Results relate only to the items tested.

| Test Description        | Instrumentation | Batch   | Extracted | Analyzed   | Analyst             |
|-------------------------|-----------------|---------|-----------|------------|---------------------|
| Sulphate (20:1 Extract) | AC/EC           | 2799579 | N/A       | 2012/03/23 | DEONARINE RAMNARINE |

Maxxam Job #: B238403  
Report Date: 2012/03/23

AMEC Environment & Infrastructure  
Client Project #: TP110076.05

|           |        |
|-----------|--------|
| Package 1 | 10.7°C |
|-----------|--------|

Each temperature is the average of up to three cooler temperatures taken at receipt

### QUALITY ASSURANCE REPORT

| QC Batch | Parameter                                  | Date       | Matrix Spike       |           | Spiked Blank |           | Method Blank |         | RPD               |           | QC Standard |           |
|----------|--|------------|--------------------|-----------|--------------|-----------|--------------|---------|-------------------|-----------|-------------|-----------|
|          |  |            | % Recovery         | QC Limits | % Recovery   | QC Limits | Value        | Units   | Value (%)         | QC Limits | % Recovery  | QC Limits |
| 2799578  | Soluble (20:1) Chloride (Cl)               | 2012/03/23 | 107                | 75 - 125  | 106          | 75 - 125  | <20          | ug/g    | NC                | 35        |             |           |
| 2799579  | Soluble (20:1) Sulphate (SO <sub>4</sub> ) | 2012/03/23 | 114 <sup>(1)</sup> | 75 - 125  | 104          | 85 - 115  | <20          | ug/g    | NC <sup>(2)</sup> | 35        |             |           |
| 2799683  | Conductivity                               | 2012/03/23 |                    |           |              |           | <2           | umho/cm | 0.1               | 35        | 99          | 75 - 125  |

N/A = Not Applicable

RPD = Relative Percent Difference

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.

Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

(1) - Matrix Spike Parent ID [MV6502-01]

(2) - Duplicate Parent ID [MV6502-01]

## Validation Signature Page

**Maxxam Job #: B238403**

---

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

A handwritten signature in black ink, appearing to read "Cristina Carriere", is written over a horizontal line.

CRISTINA CARRIERE, Scientific Services

=====

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

## **APPENDIX C**

### **SITE PHOTOGRAPHS**

**HIGHWAY 21, GODERICH, ONTARIO  
(CULVERT NO. 8 AT Sta. 11 + 691)**

**PHOTOGRAPH NO. 1**

Looking towards the existing culvert inlet and slope above the culvert.

**PHOTOGRAPH NO. 2**

Looking towards the existing culvert outlet area and the slope of the outlet.

**HIGHWAY 21, GODERICH, ONTARIO  
(CULVERT NO. 8 AT Sta. 11 + 691)**

PHOTOGRAPH NO. 3

View of the spillway  
downstream of the outlet.

PHOTOGRAPH NO. 4

View of the road and  
shoulder above the culvert.
